

ESD5200 Series **Speed Control Unit**

INSTALLATION

See Section 10 for more dimensions

START THE ENGINE (4))

The speed control unit governed speed setting is factory set at approximately engine idle speed. (1000 Hz., Speed sensor signal or 600 RPM)

Crank the engine with DC power applied to the governor system. The actuator will energize to the maximum fuel position until the engine starts. The governor system should control the engine at a low idle speed. If the engine is unstable after starting, refer to Section 6 ADJUSTING FOR STABILITY.

5) **GOVERNOR SPEED SETTING**

The governed speed set point is increased by clockwise rotation of the SPEED adjustment control. Remote speed adjustment can be obtained with an optional 5K Speed Trim Control.

ADJUSTING FOR STABILITY 6))

Once the engine is running at operating speed and at no load, the following governor performance adjustments can be made to increase engine stability.

	STABILITY ADJUSTMENT							
PARAMETER			PROCEDURE					
A. GAIN		GAIN	1.	Rotate the GAIN adjustment clockwise until instability develops.				
		2.	Then, gradually move the adjustment counterclockwise until stability returns.					
		3.	Finally, move the adjustment one division further counter- clockwise to insure stable performance (270° potentiometer).					
		4.	If instability persists, adjust the next parameter.					
B. STABILITY		1.	Follow the same adjustment procedure, steps 1 - 3, as the GAIN parameter.					
NOTE				stments made at no load achieve satisfactory performance. If mance improvements are required, refer to Section (8) SYSTEM OOTING.				

(7) **ADDITIONAL FEATURES & OPTIONAL WIRING**

After the governor speed setting had been adjusted, place the optional Idle Speed external selector switch in the IDLE position. The idle speed set point Setting is increased by the clockwise rotation of the IDLE adjustment control. When the engine is at idle speed, the speed control unit applies droop to the governor system to insure stable operation.

Speed Droop Operation	tors eng	. Wł ine	s typically used for the paralleling of engine driven genera- ten in droop operation, the engine speed will decrease as load increases. The percentage of droop is based on the r current change from no engine load to full load. WIRING

See Section 10 for the Wiring Diagram

DEFINITION TERMINAL NOTES A & B Actuator (+/-) #16 AWG (1.3mm sq) or larger wire Wires must be twisted and/or shielded for their entire length Magnetic Speed Pickup Gap between speed sensor and gear teeth should not be smaller than 0.02 in. (.51mm) C & D (D is ground) Speed sensor voltage should be at least 1V AC RMS during crank #16 AWG (1.3mm sq) or larger wire A 15 amp fuse must be installed in the E & F Battery Power (-/+) positive battery lead to protect against reverse voltage Battery positive (+) input is Terminal F Ground Signal G H & G Add Jumper for Droop Increase Variable Speed 0 - 5V DC J Input K & L Droop Select Active When Closed M & L Idle Select Ν Accessory Input Load Sharing / Synchronizing, Accessory Power Р +10 Volt Supply RECOMMENDATIONS Shielded cable should be used for all external connections to the ESD control.

One end of each shield, including the speed sensor shield, should be grounded to a single point on the ESD case.

3) ADJUSTMENTS BEFORE ENGINE STARTUP

Make sure the following adjustments are set before starting the engine.

GAIN	Middle Position
STABILITY	Middle Position
SPEED TRIM CONTROL	Middle Position

Instability

INSTABILITY	SYMPTOM		PROBABLE CAUSE OF ABNORMAL READING
Fast Periodic	The engine seems to jitter with a 3Hz or	1.	Readjust the GAIN and STABILITY for optimum control.
	faster irregularity of speed.	2.	Turn off other electrical equipment that may be causing interference.
		3.	Make sure LEAD switch SW1 is set to "OFF".
		4.	If system is still unstable, set DTC switch SW2 to "OFF".
Slow Periodic	An irregularity	1.	Readjust the GAIN and STABILITY
	of speed below 3Hz. (Sometimes severe)	2.	Set DIP switches 1 and 2 to "ON" in the following order: First SW1, Second SW2, and Third SW1 & SW2.
		3.	Check fuel system linkage during engine operation for: a. binding b. high friction c. poor linkage
		4.	Adjust the DEAD TIME COMPENSA- TION by adding a capacitor from posts E2 to E3 (negative on E2). Start with 10 mfds. and increase until instability is eliminated.
Non-Periodic	Erratic Engine Behavior	1.	Increasing the GAIN should reduce the instability but not totaly correct it. If this is the case, there is most likely a problem with the engine itself. Check for: a. engine mis-firings b. an erratic fuel system c. load changes on the generator set voltage regulator.
		2.	If throttle is slghtly erratic, but perfor- mance is fast, then move switch SW1 to the "OFF" position.

If unsuccessful in solving instability, contact GAC for assistance. info@governors-america.com or call 413-786-5600

Unsatisfactory Performance

SYMPTOM	I	NORMAL READING		PROBABLE CAUSE OF ABNORMAL READING
Engine Over- speeds	1.	Do Not Crank. Apply DC power to the governor system.	1.	After the actuator goes to full fuel, disconnect the speed sensor at Terminal C & D. If the actuator is still at full fuel-speed then the speed control unit is defective.
	2.	Manually hold the engine at the desired running speed. Mea- sure the DC voltage between Terminals A(-) & F(+) on the speed control unit.	1. 2. 3.	If the voltage reading is 1.0 to 2.0 VDC: a. SPEED adjustment is set above desired speed b. Defective speed control unit If voltage reading is above 2.0 VDC then check for: a. actuator binding b. linkage binding If the voltage reading is below 1.0 VDC: a. Defective speed control unit
Overspeed			1.	Speed adjustment set too high.
Shuts Down En- gine After			2.	OVERSPEED set to close to run- ning speed.
Running Speed is Reached			3.	Actuator or linkage binding.
neacheu			4.	Speed control unit defective.
Overspeed Shuts Down En- gine Before Running Speed is Reached	1.	Check impedance between Terminals C & D. Should be 160 to 1200 Ohms	1. 2.	OVERSPEED set too low. Adjust 5-6 turns CW. Erroneous speed sensor signal. Check wiring.

SYMPTOM	NORMAL READING			PROBABLE CAUSE OF ABNORMAL READING			
Actuator does not energize	1.	Measure the voltage at the battery while cranking.	1. Replace the battery if weak or un sized				
fully	2.	Momentarily connect Terminals A and F. The actuator should move to the full fuel position.	1. 2.	Actuator or battery wiring in error Actuator or linkage binding			
			3.	Defective actuator			
			4.	Fuse opens. Check for short in actua- tor or harness.			
Engine remains below desired governed speed	1.	Measure the actuator output, Terminals A & B, while running under governor control.	1.	If voltage measurement is within 2 VDC of the battery supply voltage level, then fuel control is restrict- ed from reaching full fuel position, possibly due to mechanical governor, carburetor spring, or linkage interfer- ence.			
			2.	SPEED parameter set too low
